Exercice d'application en Java RMI

1) La structure des interfaces : Serveur: addinterface: package ser; **import** java.rmi.Remote: import java.rmi.RemoteException; public interface addinterface extends Remote { int add(int a,int b) throws RemoteException; } nboccurencesinterface: package ser; import java.rmi.Remote; import java.rmi.RemoteException; public interface nboccurrencesinterface extends Remote { public int nboccurences(String c, String ch) throws RemoteException; Client: addinterface: package client; import java.rmi.Remote; import java.rmi.RemoteException; public interface addinterface extends Remote { int add(int a,int b) throws RemoteException; } nboccurencesinterface: package client; import java.rmi.Remote; import java.rmi.RemoteException; public interface nboccurrencesinterface extends Remote { public int nboccurences(String car, String chaine) throws RemoteException; }

2) Gestion des erreurs :

Addclass:

```
public int add(int a,int b) throws RemoteException{
return a+b; }
```

Nboccurencesinterface:

```
public int nboccurences(String c,String ch) throws
RemoteException{
    if (ch == "")
    throw new RemoteException("chaine ne doit pas etre vide");
    else if (c == "")
        throw new RemoteException("Saisir un caractere");
    int longueur=ch.length();
    int Nb=0;
    for (int i=0; i<longueur; i++)
        {if ((ch.substring(i, i+1)).equals(c))
        Nb++;}
    return Nb; }</pre>
```

3) La structure des classes Java :

AddClass:

```
package ser;
import java.rmi.RemoteException;
import java.rmi.*;
import java.rmi.server.*;
public class Addclass extends UnicastRemoteObject implements
addinterface {
    public Addclass() throws RemoteException {
        super();
      }
    public int add(int a,int b) throws RemoteException{
      return a+b;
    }
}
```

Nboccurencesclass:

```
package ser;
import java.rmi.RemoteException;
import java.rmi.*;
import java.rmi.server.*;
public class Nboccurencesclass extends UnicastRemoteObject
implements nboccurrencesinterface {
     public Nboccurencesclass() throws RemoteException {
           super();
     public int nboccurences(String c, String ch) throws
RemoteException{
              if (ch == "")
                 throw new RemoteException("chaine ne doit pas
etre vide");
              else if (c == "")
                 throw new RemoteException("Saisir un
caractere");
             int longueur=ch.length();
              int Nb=0:
              for (int i=0; i<longueur; i++)
             if ((ch.substring(i, i+1)).equals(c))
             Nb++;
             return Nb;
             }}
```

4) La classe du serveur :

<u>ServeurClass</u>:

```
package ser;
import java.rmi.*;
import java.rmi.server.*;
public class Serveurclass {

   public static void main(String[] args) {
        try {
            System.out.println("Serveur : Construction de l'implémentation");
        }
}
```

```
Addclass add= new Addclass();
System.out.println("Objet Add lié dans RMIregistry");

Naming.rebind("rmi://clementine.cnam.fr:2001/Addition", add);
Nboccurencesclass nboccurences = new

Nboccurencesclass();
System.out.println("Objet Nboccurences lié dans

RMIregistry");

Naming.rebind("rmi://clementine.cnam.fr:2001/Chaine",nboccurences );
System.out.println("Attente des invocations des clients");

}
catch (Exception e) {
System.out.println("Erreur de liaison de l'objet Objet

Nboccurences ou Objet Add");
System.out.println(e.toString());
}
}
```

5) Les commandes à lancer sur la machine clementine :

<u>Compiler les sources (interface, implémentation de l'objet et le serveur) :</u>

clementine> javac *.java

Lancer rmic sur Addclass:

clementine>rmic -v1.2 Addclass

Lancer rmic sur Nboccurencesclass:

clementine>rmic -v1.2 Nboccurencesclass

<u>Démarrer rmiregistry:</u>

clementine>rmiregistry -J-Djava.security.policy=client1.policy&

Lancer le serveur :

clementine>java ReverseServer &

6) Le programme du client :

```
package client;
     import client.nboccurrencesinterface;
     import client.addinterface;
     import java.io.*;
     import java.rmi.*;
     import java.util.Scanner;
     public class Client {
     public static void main(String[] args) throws IOException {
           try{
                 int nb=0;
                 Scanner ch = new Scanner(System.in);
                 System.out.println("Saisir une chaine ");
                 String chaine = ch.nextLine();
                 Scanner c = new Scanner(System.in);
              System. out. println ("Saisir un caractere");
              String car = c.nextLine();
                 nboccurrencesinterface nboccu =
(nboccurrencesinterface)Naming.lookup("rmi://clementine.cnam.fr:2001/
Chaine");
                 nb = nboccu.nboccurences(car, chaine);
                 System. out.println(" Dans la phrase "+ch+", il y a"+nb+"
occurrences de " + car);
                 catch (Exception e)
                 {System. out. println ("Erreur d'accès à l'objet distant.");
                 System.out.println (e.toString());
        try{
           Scanner sc1 = new Scanner(System.in);
           System. out.println("Saisir une nombre ");
          int a = sc1.nextInt();
          Scanner sc2 = new Scanner(System. in);
          System. out. println ("Saisir un autre nombre ");
          int b = sc2.nextInt();
          int somme =0:
              addinterface Add= (addinterface)
Naming.lookup("rmi://clementine.cnam.fr:2001/Addition");
              somme = Add.add(a,b);
              System. out.println(" la somme de "+a+" + "+b+" = " +
somme);
```

```
catch (Exception e)
{System. out.println ("Erreur d'accès à l'objet distant.");
System. out.println (e.toString());}
}
```

Exécution du client :

client>java -Djava.security.policy=client1.policy Client
